

## How to Configure STASH Flex

### Overview:

This article describes how to configure STASH Flex for your account.

The STASH Flex add-on allows you to specify which data centers you want STASH to use to store your data. By default, STASH will store your data in at least 3 different locations determined by STASH.

*Note: This feature is only available to STASH Business customers, who have subscribed to the FLEX add-on.*

### Steps:

1. Go to the Contact Us page on your custom STASH portal.
2. Send a note to STASH with the details of the locations you would like to use. Please include:
  - a. Name of storage provider (e.g. Amazon AWS)
  - b. Region of data center to use (e.g. US-EAST-1)
  - c. Name of data center to use (e.g. Reston)
  - d. Address of data center (street number and name, city, state, zip, country)
3. STASH will contact you to verify the details of the request and then again once your storage locations have been connected.
